Re: Des Moines TCE Site, Des Moines, IA

Dear Mr. Moon:

Enclosed please find a hazardous waste determination memo that we previously discussed regarding the demolition of the buildings at the Des Moines TCE Site. It details EPA's considerations regarding disposition of building demolition debris, in light of the documented contamination within the buildings. In summary:

- Asbestos contaminated building materials, including roofing tar and boiler/piping insulation, require abatement. IDNR staff has indicated that they are familiar with proper building demolition asbestos abatement procedures.
- PCB-containing insulation and surrounding building materials are considered PCB Bulk Product Waste. The PCB-containing insulation, yellow insulation with a foil backing, may be disposed of in a solid waste landfill if it contains less than 50 parts per million (ppm) PCBs. EPA's reading of Iowa law indicates that PCB-containing insulation with concentrations over 50 ppm cannot be disposed of in a landfill. Iowa has indicated that a special waste waiver may be applicable.
- Given the use of pure aldrin that occurred in Building 4 and the Maintenance Building, debris from the remaining foundation of Building 4 and the Maintenance Building is considered P-listed hazardous waste. As listed hazardous waste, demolition debris from the maintenance building and the foundation of Building 4 would be disposed of in a hazardous waste landfill. Building 4 and Maintenance Building foundation debris may contain trace amounts of contaminants such that a "contained in/contained out" determination could be made which would result in such debris not meeting the criteria of a listed hazardous waste.
- Buildings 1-3 and the foundation of Building 5 exhibit hazardous waste characteristics. Therefore, the Toxicity Characteristic Leaching Procedure (TCLP) would be conducted on building demolition debris from Buildings 1-3 and the foundation of Building 5 to determine whether those materials are characteristic hazardous wastes prior to disposal. Building demolition debris from Buildings 1-3 and the foundation of Building 5 that fails TCLP would be

disposed of in a hazardous waste landfill.

- Building and foundation demolition debris may contain low levels of dioxin. A receiving disposal facility will likely require one or more composite samples of building materials to determine a dioxin toxic equivalent (TEQ) concentration prior to accepting the waste.

If you have any questions or would like to discuss the information contained in this letter, please do not hesitate to contact me at 913-551-7882 or at peterson.mary@epa.gov.

Sincerely,

Mary P. Peterson
